

1.1 INFORMATION SECURITY AWARENESS

Information Security Awareness

No matter how secured a network is the most vulnerable set of individuals is always the non-IT person connected to the office network. This course is great for busy professionals who want to learn the basics of IT Security, from securing their home network using best practices, to establishing fundamental security measures in a small business where the full time IT Security staff is not present. This training will immerse participants into an interactive environment where they will acquire fundamental understanding of various computer and network security threats such as identity theft, credit card fraud, online banking phishing scams, virus and backdoors, emails hoaxes, sex offenders lurking online, loss of confidential information, hacking attacks and social engineering.

This course, a Corporate Security Awareness program brings all employees in an organization to a common security knowledge baseline. When consumer information is present, employees must understand how to keep this information safe and secure.
